- Menu fichier

Aperçu du menu fichier

- Menu fichier

Ouverture d'un fichier

```
void CodeEditorController::open(){
    QFile file(m_path);
    if(!file.open(QIODevice::ReadOnly | QIODevice::Text)){
        QMessageBox::warning(m view, "impossible d'ouvrir le fichier", "Impossible d'ouvrir le fichier "+m path);
        return;
    m view->setUndoRedoEnabled(false);
    QTextStream in(&file);
    while(!in.atEnd()){
        m view->appendPlainText(in.readLine());
    file.close();
    m view->setUndoRedoEnabled(true);
    m view->document()->setModified(false);
    if(m item != nullptr){
        connect(m item,SIGNAL(rename(QString)),this,SLOT(rename(QString)));
        connect(m_item,SIGNAL(suppr()),this,SLOT(fileSuppr()));
    QTextCursor cursor = m view->textCursor();
    cursor.movePosition(OTextCursor::Start);
    m view->setTextCursor(cursor);
```

- Menu édition

```
if(m_me->radio2->isChecked()){
    if(m_me->casse->isChecked()){
        while(editor->find(QRegExp(mot), QTextDocument::FindCaseSensitively)){
            m_me->count++;
            QTextEdit::ExtraSelection extra;
            extra.format.setBackground(color);
            extra.cursor = editor->textCursor();
            m_me->extraSelections.append(extra);
}
```

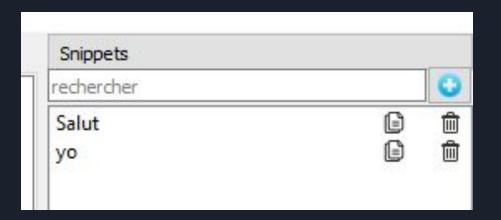

Fonction de remplacement dans l'éditeur de texte

Fonction de recherche dans l'éditeur de texte

```
while(editor->find(m_me->mot->text())){
        OTextEdit::ExtraSelection extra:
        extra.format.setBackground(color);
        extra.cursor = editor->textCursor();
       extraSelections.append(extra);
       OTextCursor gc = editor->textCursor();
       if(qc.hasSelection()){
           isExist = true;
           qc.insertText(m me->newMot->text());
       } else
            break;
   QMessageBox msgBox(QMessageBox::Warning, "Mot inexistant", "Le mot n'existe pas.");
   msgBox.exec();
   s Replace():
   return;
editor->setExtraSelections(extraSelections);
```

Partie 3 - Snippets

Aperçu des snippets

Partie 3 - Snippets

Controller des snippet

```
void SnippetController::addSnippet(){
    SnippetDialog sd(m_sni->m_model);
    if(sd.exec() == QDialog::Accepted){
        qDebug() << "création du snippet";
        m_sni->m_model->addSnippet(sd.getSnippetName());
    }
}

void SnippetController::modifyFile(const QModelIndex &index){
    m_sni->m_fen->getController()->openEditor(QCoreApplication::applicationDirPath()+"/Snippets/" + m_sni->m_model->data(index,Qt::DisplayRole).toString() + ".java");
}
```

Partie 4 - Console

Aperçu de la console

```

Partie 4 - Console

Historique des commandes écrites

```
if(e->key() == Qt::Key_Up){
    QTextCursor cursor = this->getCurrentCmd();
    if(histoIndex == this->historique.size()-1){
        currentCmd = cursor.selectedText();
}
cursor.removeSelectedText();
if(this->historique.size() > 0)
        this->insertPlainText(this->historique[histoIndex]);
if(histoIndex>0)
        histoIndex--;
return;
```

Mise en place d'un processus

```
void Console::build(){
    cmd.write("make\n");
    execute();
}

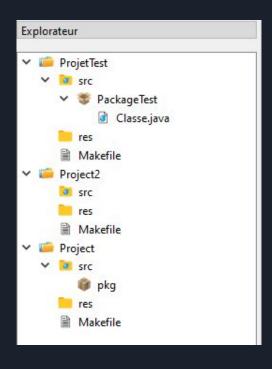

void Console::execute(){
    cmd.write("make run\n");
}

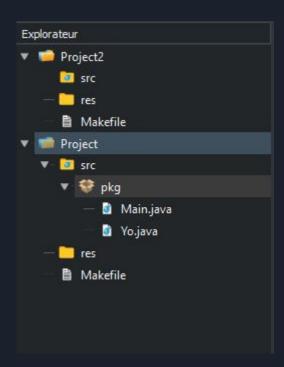

Console::~Console(){
    cmd.close();
}
```

Partie 5 - Modèle

Récupération chemin des projets et chargement du modèle

Aperçu de l'explorateur

- Renommage

Contrôle du nom donné par l'utilisateur

```
void ExplorerDelegate::setModelData(QWidget *editor, QAbstractItemModel *model, const QModelIndex &index) const{
    TreeItem *item = (TreeItem*)index.internalPointer();
    QLineEdit* edit = (QLineEdit*)editor;
    if(edit->text().size() <= 0 || edit->text() == item->label()){
        return;
    if(typeid(*item) == typeid(DProject)){
       QDir dir(item->getPath());
       dir.cd("..");
        if(dir.exists(edit->text())){
            OMessageBox::information(nullptr, "erreur de renommage", "Un dossier portant ce nom existe déjà à cet emplacement");
            return;
        OStyledItemDelegate::setModelData(editor,model,index);
        return;
    if(item->parent()->exist(edit->text())){
        QMessageBox::information(nullptr, "erreur de renommage", "Un autre élément du même dossier porte déjà ce nom.");
        return;
```

- Renommage

Contrôle du nom donné par l'utilisateur

```
bool Model::setData(const QModelIndex &index, const QVariant &value, int role){
    if(!index.isValid()){
        return false;
    if(role == Qt::EditRole){
        TreeItem* item = ((TreeItem*)index.internalPointer());
        if(!item->setLabel(value.toString())){
            return false;
        emit dataChanged(index,index);
        item->save();
        return true;
    return false;
```

- Renommage

```
bool TreeItem::setLabel(QString label){
    QFileInfo fi(getPath());
    if(!QFile::rename(fi.path()+"/"+m_label,fi.path()+"/"+label)){
        QMessageBox::warning(nullptr,"erreur renommage","impossible de renommer le fichier "+fi.path()+"/"+label);
        return false;
    }
    this->m_label = label;
    emit rename(fi.path()+"/"+label);
    propagRename();
    return true;
```

Partie 7 - Editeur

- Coloration syntaxique

```
1 public class BinaryTree {
       Node root;
       public void addNode(int key, String name) {
           Node newNode = new Node(key, name);
           this.value = 10;
           int[] tab = new int[10];
           String str = "chaine de caractère";
8
10
           if (root == null) {
               root = newNode;
14
               Node focusNode = root;
16
17
               Node parent;
18
               while (true) {
                   parent = focusNode;
                    if (key < focusNode.key) {</pre>
20
21
                       focusNode = focusNode.leftChild;
22
                       if (focusNode == null) {
                           parent.leftChild = new Node;
24
26
                    } else {
27
                        focusNode = focusNode.rightChild;
28
                        if (focusNode == null) {
29
                           parent.rightChild = new Node;
30
32
```

Partie 7 - Editeur

- Coloration syntaxique

Coloration des mots clés

```
keywordFormat.setFontItalic(true);
const OString keywordPatterns[] = {
    QStringLiteral("\\bchar\\b"), QStringLiteral("\\bclass\\b"), QStringLiteral("\\bconst\\b"),
   OStringLiteral("\\bdouble\\b"), OStringLiteral("\\benum\\b"), QStringLiteral("\\bexplicit\\b"),
   OStringLiteral("\\bString\\b"), OStringLiteral("\\bint\\b"),
   QStringLiteral("\\blong\\b"), QStringLiteral("\\bnamespace\\b"), QStringLiteral("\\boperator\\b"),
   QStringLiteral("\\bshort\\b"), QStringLiteral("\\bsignals\\b"), QStringLiteral("\\bsigned\\b"),
    QStringLiteral("\\bvoid\\b"), QStringLiteral("\\bvolatile\\b"), QStringLiteral("\\bboolean\\b")
};
for (const QString &pattern : keywordPatterns) {
   rule.pattern = QRegularExpression(pattern);
   rule.format = keywordFormat;
    highlightingRules.append(rule);
```

- Coloration syntaxique

Fonctionnement des commentaires

```
for(int i = startIndex; i < text.length();i++){</pre>
       if(text[i] == "/"){
            if(i+1 >= text.length()) continue;
            if(text[i+1] == "/"){
                setFormat(i,text.length(),commentFormat);
                return;
            }else if(text[i+1] == "*"){
                int start = i;
                bool isClose = false;
                for(i=i+2;i < text.length();i++){</pre>
                    if(text[i] == "*" && i+1 < text.length() && text[i+1]=="/"){</pre>
                        setFormat(start, i-start+1,commentFormat);
                        isClose = true;
                        break;
                if(!isClose){
                    setFormat(start, text.length(),commentFormat);
                    setCurrentBlockState(1);
                    return;
```

Auto indentation

```
if(event->key() == Qt::Key_Tab){
    this->insertPlainText(textTab);
    textTab = "";
}
```

Auto complétion d'une parenthèse

```
if(event->key() == Qt::Key_ParenLeft){
    this->insertPlainText(")");
    this->moveCursor(QTextCursor::PreviousCharacter);
}
```

Recherche des accolades/guillemets/crochets/parenthèses correspondants

```
QTextBlock next = this->textCursor().block();
   int count = 0, index = -1;
   while(next != this->document()->end()){
       QString str = next.text();
       for(; pos < str.length(); pos++){</pre>
           if(str[pos] == left)
               count++;
           else if(str[pos] == right)
               count --;
           if(count == 0){
               index = next.position() + pos;
               break;
       if(count == 0) break;
       next = next.next();
       pos = 0;
```

- Controller de l'éditeur

Appel à chaque ouverture d'éditeur

```
void Controller::openEditor(const QModelIndex &index){
    TreeItem *item = (TreeItem*)index.internalPointer();
    if(typeid(*item) == typeid(TreeItem) || typeid(*item) == typeid(DJavaFile) ){
        QTabWidget *tab = this->fen->getCentral();
        for(int i = 0; i < tab->count();i++){
            if(((DCodeEditor*)tab->widget(i))->getController().isItem(item)){
                tab->setCurrentWidget(tab->widget(i));
               return;
        DCodeEditor *edit = new DCodeEditor(item,tab);
        tab->addTab(edit,item->label());
        tab->setCurrentWidget(edit);
```

Merci de nous avoir écouté
